

Visual AI automation, built for regulated EU teams.

Describe what you want to automate. Corelyx designs the agent graph, you tune it visually — then it runs itself.

AI workflow generation

GDPR + AI-Act infrastructure

Human approval gates

Automation tools weren't built for teams that get audited.

Data leaves the EU

Zapier and Make are US-first. EU ops teams can't route customer data through them without a procurement fight.

No proof of what ran

When a workflow fires incorrectly, there's no run-level audit trail to show a regulator or a customer.

No human checkpoint

Sensitive actions — messages, record changes — fire automatically. Approval gates are missing or premium add-ons.

AI bolted on, not designed in

"Generate with AI" buttons produce black-box logic that diverges from what actually executes.

One loop: describe it, see it, run it.

01

Describe

Plain language in. Genesis runs an EU-regulatory pre-filter, then generates a validated workflow graph — triggers, branches, connectors, approval points.

02

Tune visually

The graph is the executable schema. What you see is what runs — no hidden YAML. Edit any node, add an approval gate, inspect before activating.

03

Run & prove

The runtime executes with server-side credentials. Every run records node status, outputs, approvals, and failures as compliance evidence.

Schema-first architecture — the canonical JSON workflow is the single source of truth shared by the editor and the runtime.

The combination is the moat.

	Corelyx	Zapier	n8n	Make
AI workflow generation	Native (Genesis)	None	None	None
GDPR posture	Architectural	Bolt-on	Self-host only	Bolt-on
Human approval gates	Built-in	No	Limited	No
Data residency	EU infra	US-first	DIY	US-first
Per-run Art. 30 records	Yes	No	No	No

One sentence: build a workflow with AI, see exactly what runs, require human approval, and produce GDPR Art. 30 records — without leaving the product or booking a sales call.

Compliance is structural — and already documented.

GDPR

- Completed DPIA + ROPA (controller & processor)
- DPA on-product, no sales call
- Code-backed subprocessor registry
- Per-run Art. 30 processing records
- Self-service export, delete, Art. 18 restrict

EU AI Act

- Deployer, not provider — no training/fine-tuning
- AI System Inventory for both AI systems
- Art. 14 oversight: AI programs inactive until reviewed
- Art. 50 transparency: model shown, AI-generated badge
- Art. 5 prohibited uses banned in ToS

Data residency

- Supabase Frankfurt · Vercel FRA/DUB · Railway AMS
- TLS 1.3 in transit · AES-256 at rest
- EU-only workspace mode blocks risky providers
- PII pseudonymized before the LLM
- Austrian law · Austrian DPA

Built to be trusted, not just to demo.

Stack

Web	Next.js 15 · React Flow editor · API routes
Runtime	Python · FastAPI · LangGraph executor
Data	Supabase Postgres · Auth · RLS · Vault
Shared	Zod schema + validators · generated DB types
Ops	Stripe · Inngest orchestration · Resend

Security controls

- Postgres RLS — every row tenant-scoped
- Secrets in Vault, never returned to the browser
- Email 2FA on API routes; forged auth headers blocked
- PII pseudonymized before any prompt leaves the EU
- Prompt-injection guard on agent nodes
- Provider-signed webhooks; signed internal calls
- Coordinated disclosure + 24h–90d patch SLAs

Approval gates are enforced in the engine — not bypassable via the API.

Two months from zero to a sellable surface.

200+

connectors live

2 mo

first commit to product

2

AI systems documented

100%

EU-region production infra

What that velocity bought: a multi-tenant product, an AI generation pipeline, a Python execution runtime, 200+ connectors, and a complete EU-compliance documentation set — DPIA, ROPA, DPA, AI inventory, subprocessor registry. Compliance was designed in from day one, not retrofitted.

Subscription SaaS, with AI cost under control.

Free	Solo	Team	Scale
€0	€9.90	€19.90	€49.90
/mo	/mo	/mo	/mo
2 programs · 50 runs/mo	5 programs · 75 runs · BYOK	Unlimited · 3 seats · approvals · 500 runs	Higher limits · more seats · history

Margin protection: BYOK on paid tiers pushes LLM spend to the customer's own provider account; metered platform credits cover the no-setup path. We don't subsidize unbounded inference. EUR-invoiced by an EU entity.

We know our gaps. Here's the plan to close them.

- **Legal structure** Incorporate (AT GmbH) · appoint/contract a DPO
- **AI data path** Enterprise DPA + EU routing with OpenRouter, or move the platform default to an EU-hosted model
- **Security assurance** Third-party pentest · SOC 2 Type I path
- **Google scopes** Complete CASA verification to scale Gmail beyond the pilot cap
- **Go-to-market** Land EU ops/compliance design partners; convert pilots to paid

We disclose these in our own public docs. Honest gaps + a funded plan beat a polished claim that doesn't survive diligence.

The automation tool an EU compliance team can actually buy.

AI-generated workflows · visual, inspectable execution · human approval gates · GDPR & AI-Act evidence built in.
Strong product ahead of the corporate structure — the round closes that gap.
